

TOP 10 REASONS

WHY THE UDO ARCHIVE APPLIANCE BEATS DISK FOR LONG-TERM ARCHIVING

1. **Simple to install and maintain**

Fully integrated, network attached solution that doesn't require special power and cooling infrastructure

2. **Non-proprietary application interface**

Standard file system interface that doesn't depend on a proprietary API

3. **High performance RAID cache**

True RAID cache performance that isn't compromised by the data handling overheads of a CAS system

4. **Unmatched media life**

The 50 year media life of UDO beats disk technology hands down

5. **Unquestioned record authenticity**

The UDO true Write Once media is the gold standard for record storage authenticity - far superior to magnetic disk products that can only emulate what is native to UDO

6. **Affordable disaster recovery**

Not forced to buy a second mirrored system for disaster recovery requirements when off-line duplicate UDO media will do the job at a much lower cost

7. **Efficient scalability**

Scales without dramatically increasing infrastructure burden and easily accommodates cost-effective off-line archive options

8. **Proven technology roadmap**

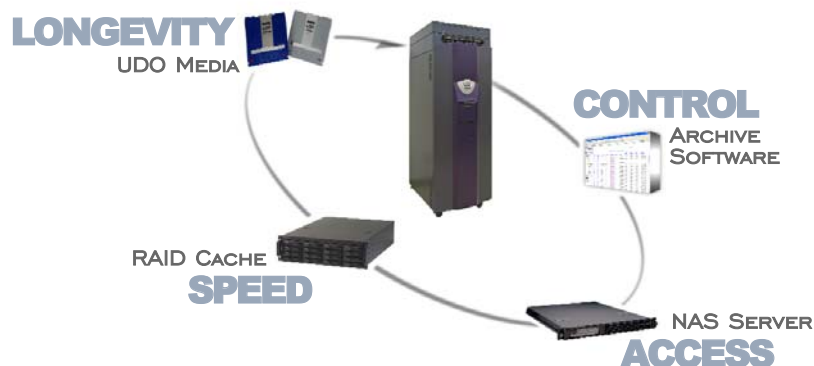

Protecting investment with product support cycles lasting years, not months and a backward compatible future roadmap that ensures technology continuity

9. **Lower operational overhead**

No need to backup stable UDO media unlike volatile spinning disk - Also reduces the demand for frequent data migration

10. **Lower Total Cost of Ownership**

The economics are simple - Lower acquisition, maintenance and operating costs
